```
server_addr.sin_addr.s_addr = htonl(INADDR_ANY); // Listen on any IP address bind(server_s, (struct sockaddr*)&server_addr, sizeof(server_addr)); // Fill-in client1 socket's address information client_addr.sin_family = AF_INET; // Address family to use client_addr.sin_port = htons(PORT_NUM); // Port num to use
client_addr.sin_addr.s_addr = inet_addr(IP_ADDR); // IP address to use // Wait to receive a message from client1 addr: len = sizeof(client_addr); recvfrom(server_s, in_buf, sizeof(in_buf), 0, (struct sockaddr*)&client_addr, &addr_len); // Output the received message printf("Message received is: '%s', in buf); // Spin-loop to give client1 time to turn-around for (i=0; i>> Step #5 h. addr, 4); // Create a socket for remote remote_s = socket(AF_INET, SOCK_STREAM, 0); // Fill-in the server (remote) socket's address information and connect // with the listening server. The file is a convenient concept for the programmer, and is a useful unit of access control and protection for the OS. What does the function do? This approach may lead to improved efficiency and coding convenience. If the value is nonzero, then this is the parent process, and the main line of execution can continue. M03_STAL4290_09_GE_C03.indd 141 5/9/17 4:38 PM 142 Chapter 3 / Process Description and Control a resource, such as a file or a shared section of virtual memory, that is not immediately available. Each image includes not only the regions illustrated in Figure 3.13 but also program, data, and stack areas for kernel programs. Termination moves the process to the Exit state. Controls the memory management hardware and data structures which map virtual addresses in the process's address space to physical pages in the computer's memory. Windows virtual memory management will be described in Chapter 8. During the course of execution of a program, memory references by the processor, for both instructions and data, tend to cluster. The availability A of a system can be expressed as follows: A = MTTF MTF + MTTR Table 2.4 shows some commonly identified availability levels and the corresponding annual downtime. • Zombie: The process has been terminated but, for some reason, still must have its task structure in the process table. • Power manager: Coordinates power management among various devices and can be configured to reduce power consumption by shutting down idle devices, putting the processor to sleep, and even writing all of memory to disk and shutting off power to the entire system. Multiprocessor, Multicore, and Real-Time Scheduling 10.1. Multiprocessor and Multicore Scheduling 10.2. Real-Time Scheduling 10.3. Linux Scheduling 10.4. Unix Svr4 Scheduling 10.5. Unix FreeBSD Scheduling 10.6. Windows Scheduling 10.7. Summary 10.8. Key Terms, Review Questions, and Problems V • Windows provides mechanisms for sharing data and resources between processes and flexible interprocess communication capabilities.
